

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact [support@jstor.org](mailto:support@jstor.org).

sometimes sets up a mental disturbance that manifests itself the next day. A special relation between dreaming and alcoholic delirium has also been noticed. Dreams may play an important part as a determining cause of epileptic attacks. Nocturnal hysterical fits are sometimes determined by terrifying dreams. A remarkable case of psychic-paralysis due to the same terrifying dream for several successive nights is described. The same patient afforded also a good example of fatigue-paralysis, becoming incapable of phonation after the discharge of another centre. The author concludes that dreaming, and especially repeated dreaming, must not be considered an indifferent phenomenon, but may constitute the opening scene of a morbid drama. The reader would probably ask Dr. Féré whether such dreams as he describes were not caused by the paralysis, and not conversely as he assumes.

*Onamatomania.* CHARCOT and MAYMAN. *Archiv. of Neurol.* 1886.

A group of symptoms is designated where a single word plays an important role, often causing anxiety, and co-existing with habitual dubitations, fear of contact, or inverted sexual sensations, etc. (1) A single word or name may be irretrievably forgotten; (2) the patient may be impelled to continuously repeat a word; (3) in conversation certain words are emphasized; (4) certain words are used to check the effect of other accidental expressions; (5) as a word may seem to be accidentally swallowed, and great effort is made by hawking and spitting to bring it forth from the stomach. In such cases the patient has full consciousness of his state, and knows his enslavement to these tyrannous impressions. Seven cases are described where the loss of a word caused great disquietude, and when it was found another was lost, and lists of words were made out and kept at hand for relief.

*Experiments on Prehension.* J. JACOBS. *Mind*, Jan., 1887. With Supplementary Notes on Prehension in Idiots by FRANCIS GALTON.

In these experiments the "span" of "prehension" is measured by the number of letters and numerals that can be correctly repeated after twice hearing, the interval between them in the dictation being about one-half a second. Ebbinghaus's nonsense syllables we at first tried, but rejected because they were found to distract attention and to be too variable in ease of pronunciation, rhythm, degree of novelty and grotesqueness, etc. Numerals are not only fewer than letters, but have less associations by contiguity. Between the ages of eight and nineteen the span of school-girls increases from 6. to 7.9 for letters, and from 6.6 to 8.6 for numerals. Span increases not only with age, but with rank in class, and it is suggested that a "standard span" be added to the items for anthropometric measurement. Mr. Galton found greater individual variation in idiots, but less average span than in normal children.

*Ueber Ziele und Wege der Volkerpsychologie.* W. WUNDT. *Philos. Studien.* Heft 1. 1887.

The comprehensive program of Volks-psychology given by Lazarus and Steinthal, in the first volume of their journal makes it include language, religion, myth, customs, art and history, and contrast it with individual psychology. As descriptive natural history is illustrated by physics, chemistry and psychology, so history needs
